Global Pharma Sales Intelligence Dashboard (Power BI)

Overview

This project presents an interactive Power BI dashboard designed to analyze global pharmaceutical sales, product performance, and inventory risks. It enables stakeholders to make data-driven decisions through visual insights and key performance indicators.

Objective

- Monitor sales performance across regions
- Identify top-performing products
- Analyze customer demand trends
- Detect inventory risks (low stock & expiry)
- Support strategic business decisions

Dashboard Components

1. Executive Overview
    - Total Sales, Profit, YoY Growth
    - KPI Cards and trend visuals
2. Sales Analysis
    - Monthly and yearly sales trends
    - Regional comparisons
3. Product Performance
    - Top and bottom products
    - Category-wise contribution
4. Regional Insights
    - Sales distribution by geography
    - Market performance comparison
5. Inventory & Supply Chain
    - Stock levels
    - Expiry risk tracking

Data Model

- Star Schema design
- Fact Table: Sales
- Dimension Tables: Product, Customer, Region, Date

Key DAX Measures

- Total Sales
- Profit Margin %
- YoY Growth %
- Moving Average
- Top N Products

Data Processing

- Data cleaning using Power Query
- Handling null values and duplicates
- Data type standardization

Key Insights

- Chronic medicines generate the highest revenue
- South Asia leads in sales volume
- Increased demand for vitamins and antibiotics
- Inventory risks identified for low stock items

Tools & Technologies

- Power BI Desktop
- DAX
- Power Query
- CSV Dataset

Outcome

The dashboard provides a centralized platform for monitoring pharmaceutical business performance, enabling faster and more informed decision-making.

Note

This project uses simulated pharmaceutical data for demonstration purposes only.
